

PROJECT 1 – DATA QUALITY & CLEANING REPORT

Dataset Overview

The dataset contains 1,200 records and 14 columns representing customer orders from an online shopping business. Each row represents a unique customer order and contains information about customers, products, payments, order status, and referral sources.

Issues Identified

Missing values were found in the CouponCode column.

Potential duplicate OrderID and TrackingNumber records required verification.

TotalPrice calculations required validation.

Date formatting and category consistency required review.

Actions Taken

Investigated missing CouponCode values and determined that blank values represented orders where customers did not use a coupon.

Replaced blank CouponCode values with "No Coupon".

Verified that OrderID records were unique.

Validated that TotalPrice equals Quantity × UnitPrice for all records.

Audited PaymentMethod, OrderStatus, and ReferralSource categories and confirmed consistency.

Verified that the Date column is stored as a valid date format.

Validation Performed

Duplicate check completed on OrderID.

Revenue validation completed using Quantity × UnitPrice.

Missing value assessment completed.

Date validation completed using MIN() and MAX().

Category standardization review completed.

Final Quality Status

The dataset passed all validation checks. Missing values were appropriately handled, duplicate records were not found, revenue calculations were accurate, categorical fields were standardized, and date values were valid. The dataset is ready for analysis and reporting.
